

MICROBIAL ANALYSIS

SHARE THE BIG RISK OF MISSING SMALL HAZARDS

How can Viridis help you reduce your risks?

Most contractors are familiar with Safety documentation and personal protection for their workers. Yet many fail to consider the risks of wrongly assuming they do not need to know the microbial status before and after restoring a water damaged or mould affected building.

Viridis offers simple, pointed, cost-competitive laboratory reports. We use the samples you send to inform your processes and assist in safely completing a restoration project. We help you infuse confidence in your client and the owner/manager of the building you are returning to use.

We can even show you how to further reduce risks in your sampling through customised training and supervision/auditing of your reports and on site testing. We can even tailor our services and turnaround times to work for you and go beyond satisfying your client.

For \$55 a sample incl. GST, choose a test below to discover:

How do you treat a surface following IICRC methods? Find out if mould is Condition 1, 2 or 3 based on surface sampling.

If there's a high risk of bacterial and viral contamination and disease after Category 3 events - *E. coli* testing will let you know.

Culturable airborne mould and total counts analysed to let you know let you know if there is likely an indoor source.

Other services include data interpretation of indoor air quality measurements, including all of those prescribed under NABERS and other standards.
